TREFECTA DRT E-BIKE, FURTHER AND FARTHER

30.03.2015 : Winston Smith

There are no rules saying you have to sweat to reach a decent speed on a bicycle. The Trefecta DRT e-Bike pushed the concept event further by letting your commute to work, wherever it may be, without any effort. Its military specs and look are made of a 20" aluminum frame, sheltering electronics as the roads you are riding on keep you awake.

The DRT allows more efficiency at low speeds and electrical power assistance when speed, or may I say torque, is needed. Like a real combustion motorcycle, throttle, suspension settings, gear selection are operated using fly by wire controls on the handlebar.

Its backlit center display displays every relevant information one needs, staying as sober as its stealthy shape is. Trefecta thought about everything since one can simply fold the bike, just in case you can't get rid of the DRT, on any continent. Up to 60 miles (after a three hours charge), this superbike will run up to 43mph. We are reaching this era where diminishing returns are getting reversed.
